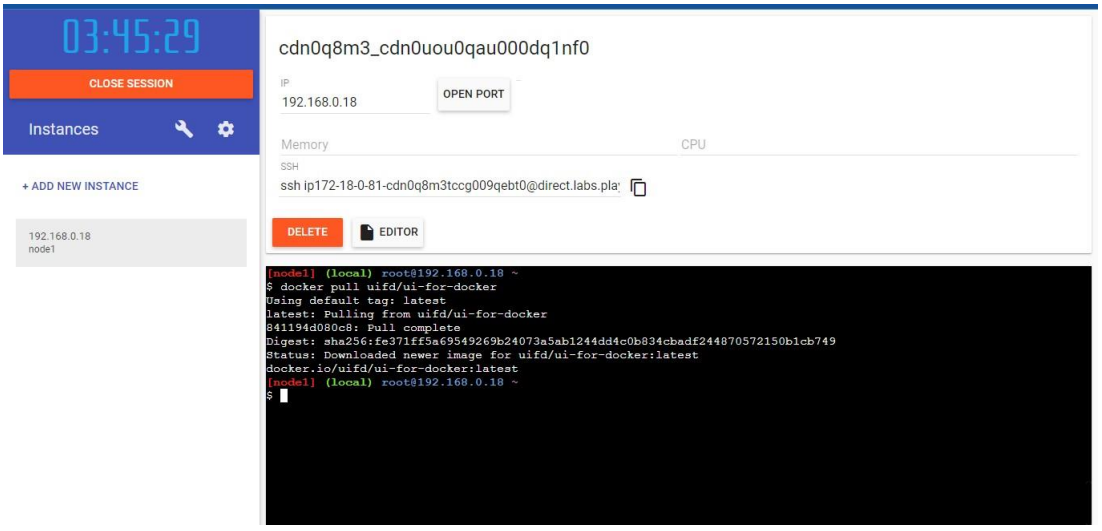
Assignment - 4

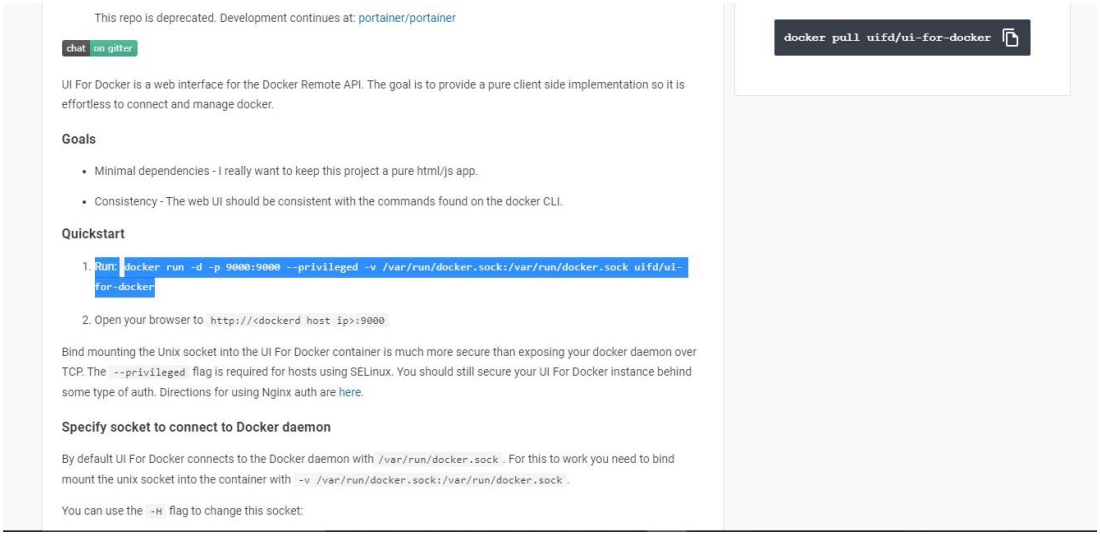
Kubernets/Docker

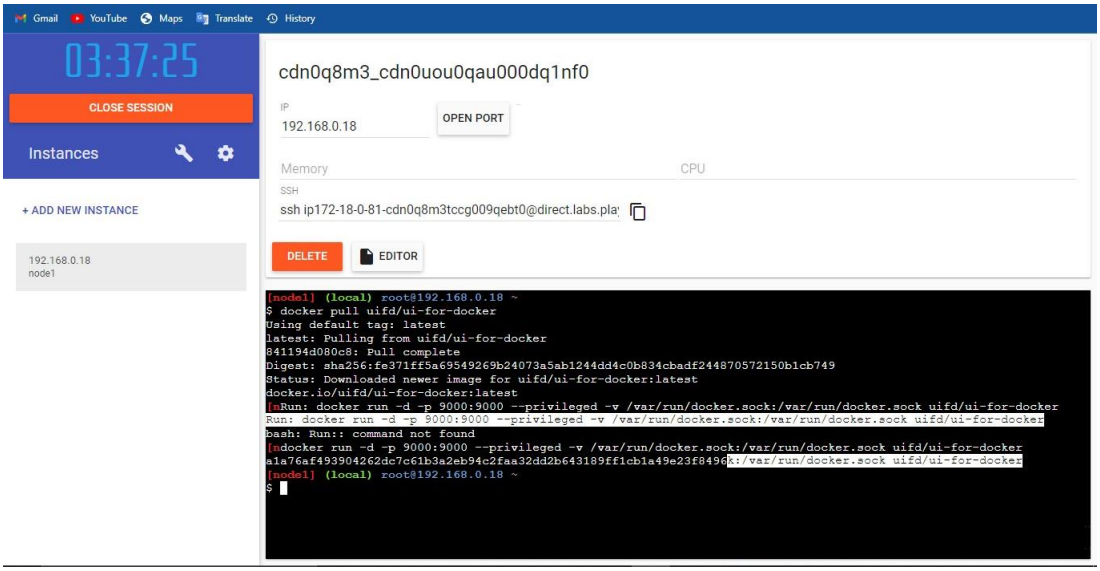
Assignment Date	19 November 2022
Student Name	Mugunthan k
Student Roll Number	19TUEC127
Maximum Marks	2 Marks

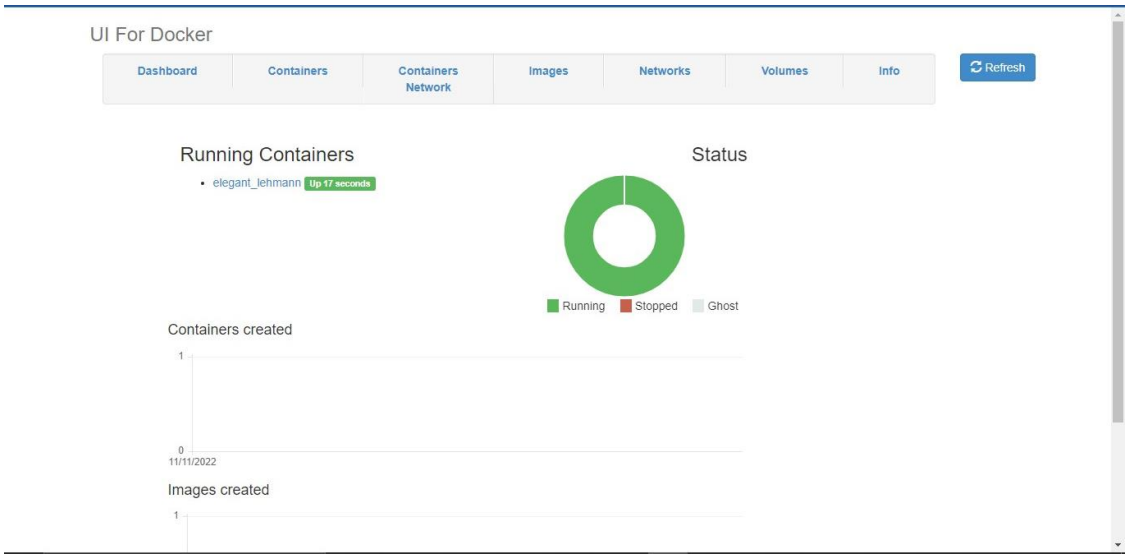
1. Pull an image from docker hub and run it on docker playground.



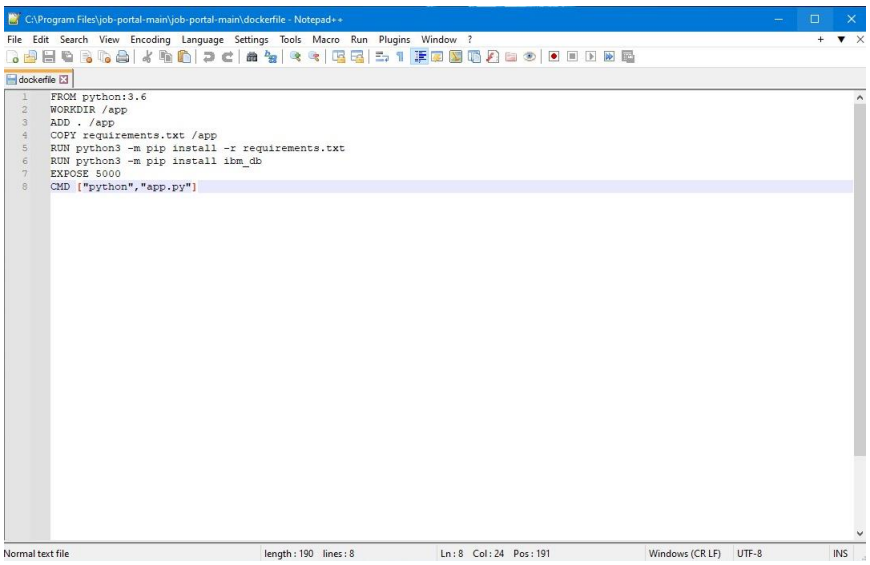
To run a pulled image in docker playground, copy the run command of the pulled image.

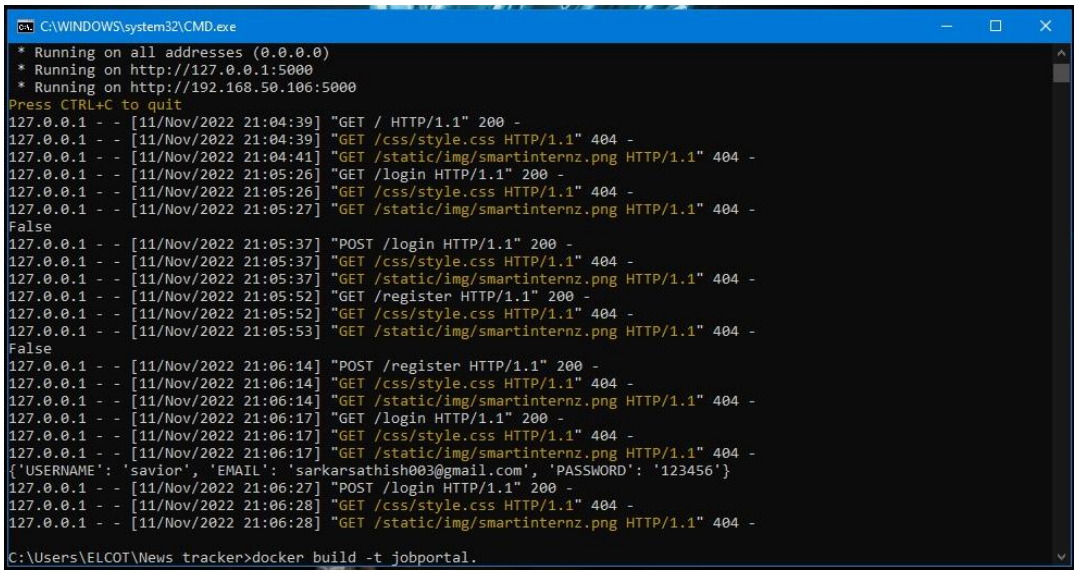






2. Create a docker file for the job portal application and deploy it inDocker desktop application.





C:\WINDOWS\system32\CMD.exe
* Running on all addresses (0.0.0.0)
* Running on http://127.0.0.1:5000
* Running on http://192.168.50.106:5000

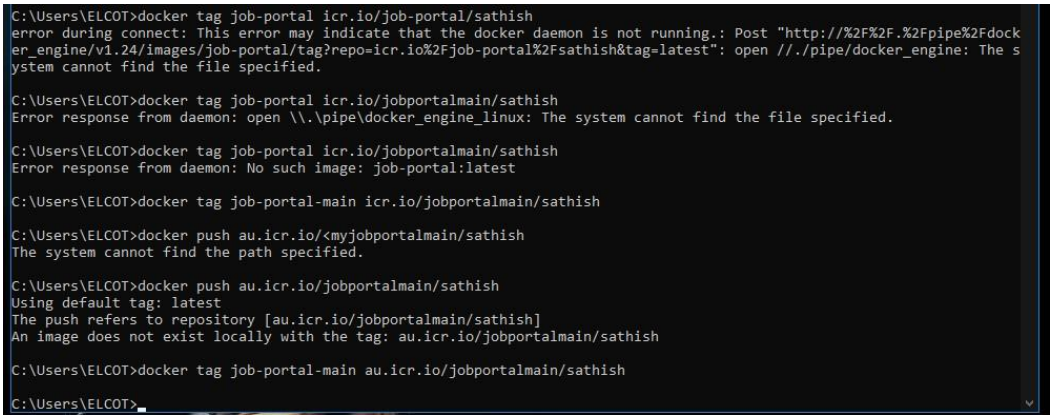
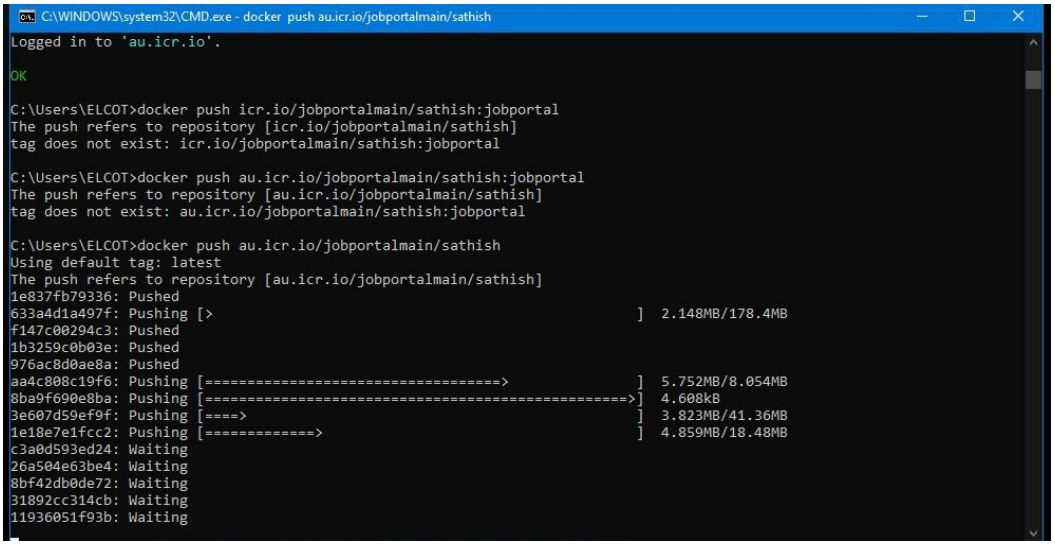
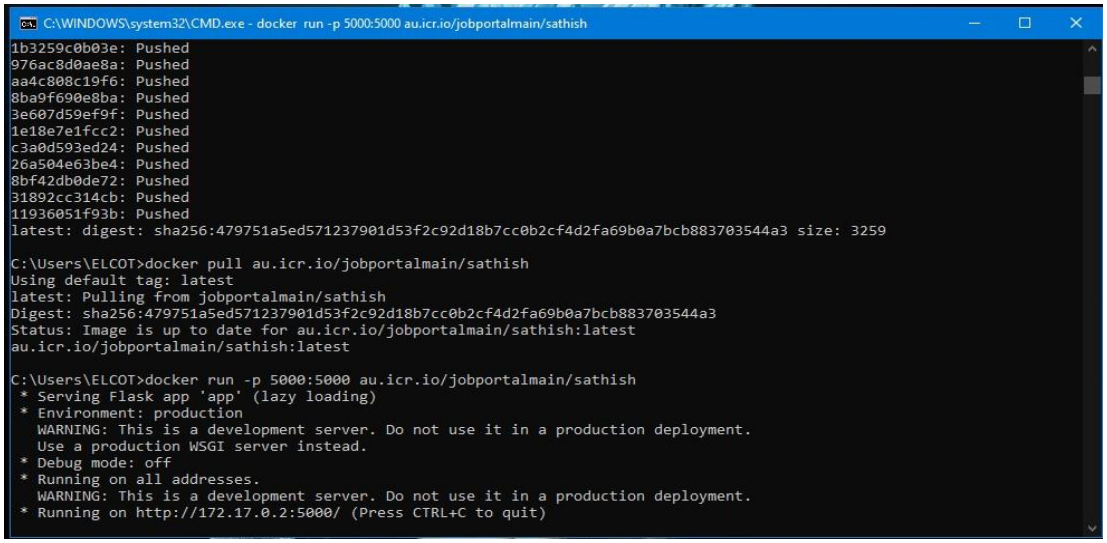
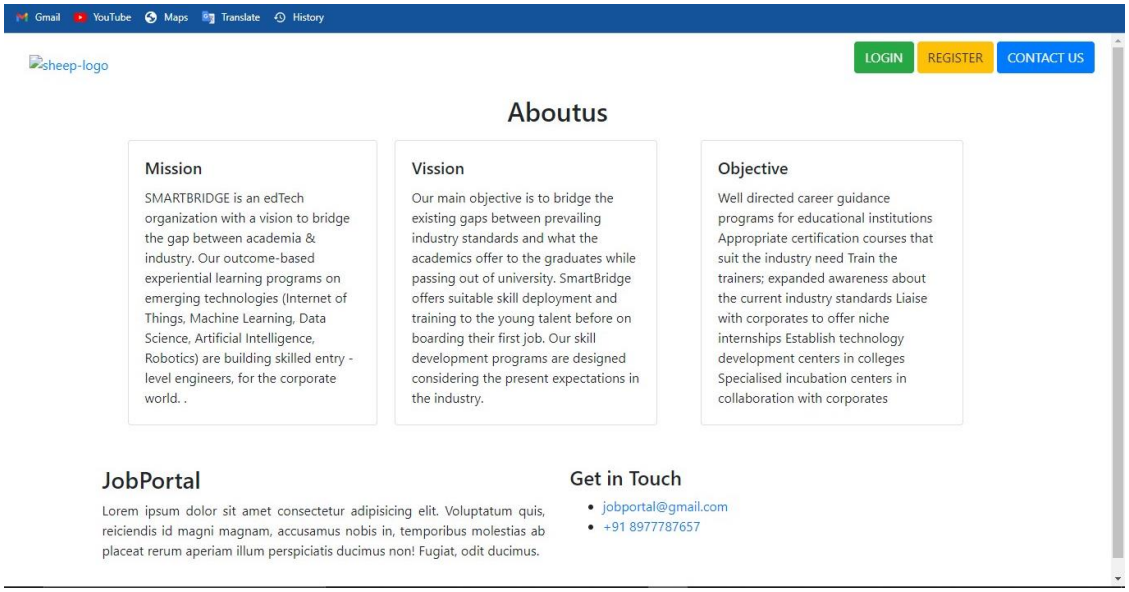
Pushing the image to repository

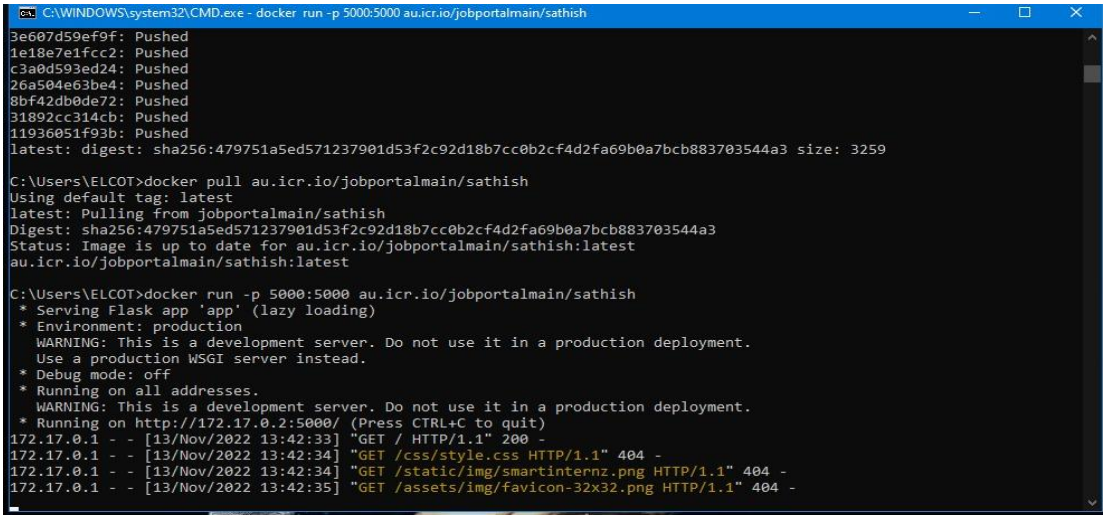




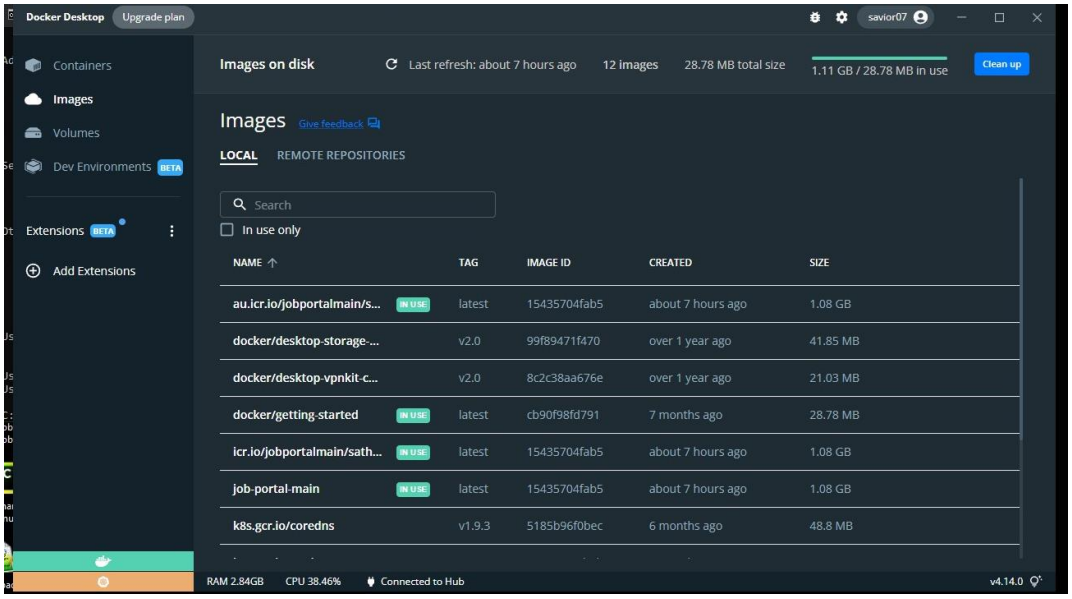
Pulling the image from IBM container and runnig it.

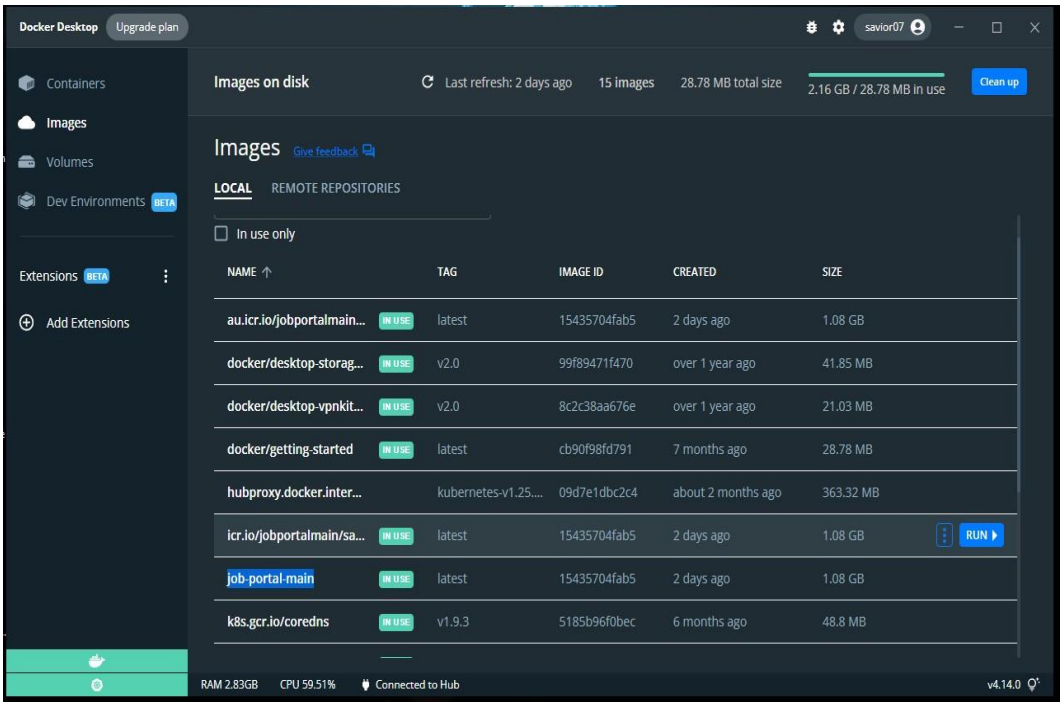


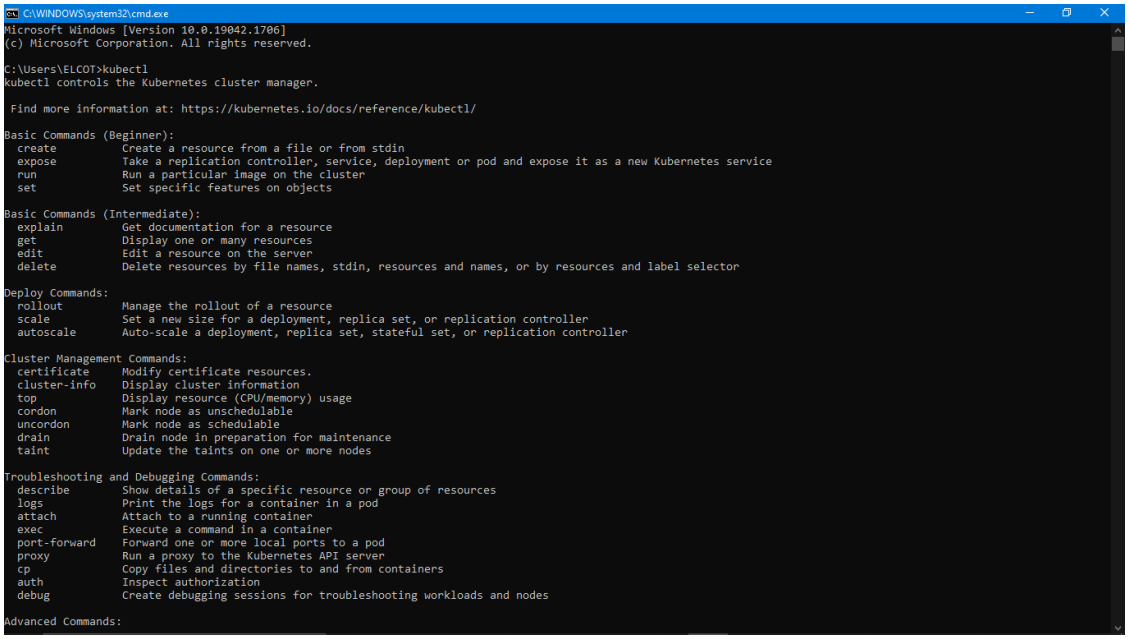




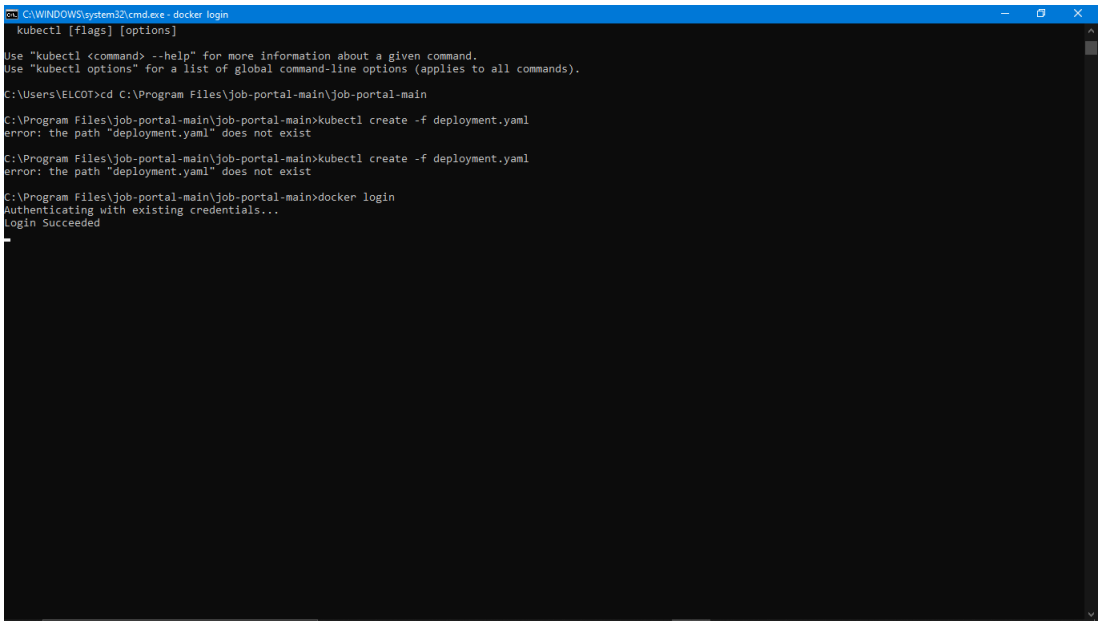
3. Create a Kubernets Cluster in IBM cloud and deploy hello world image or job portal image.



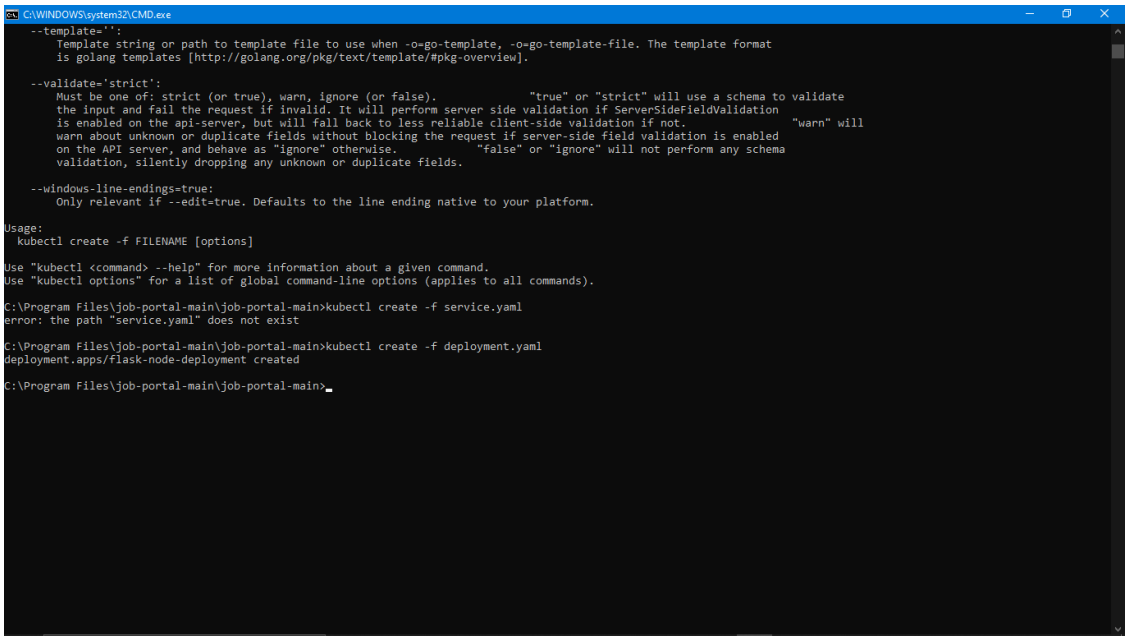




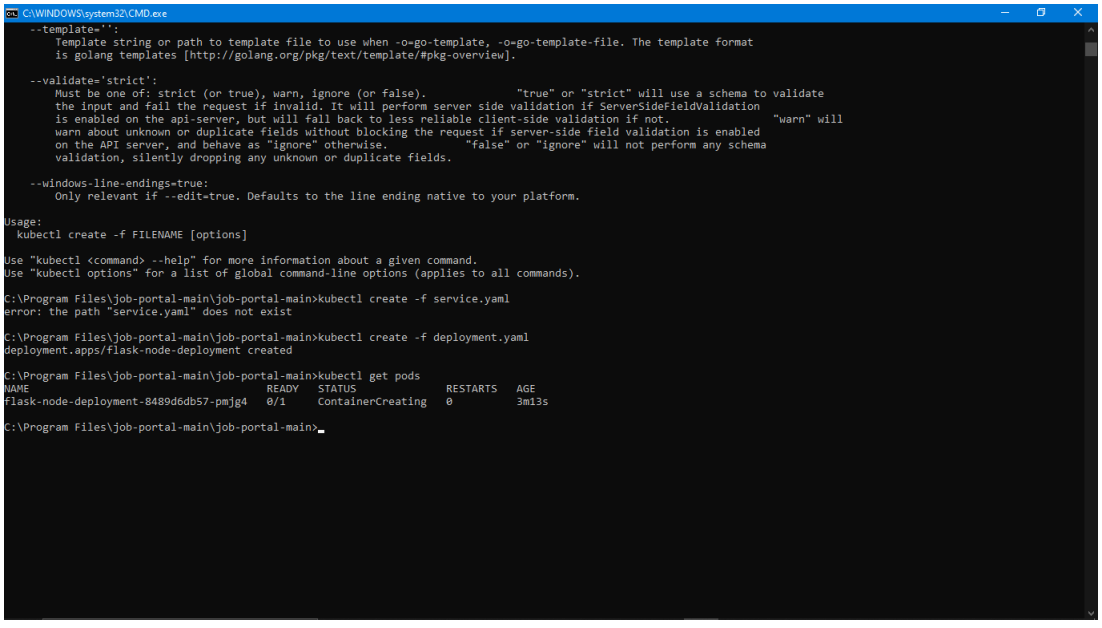
C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.19042.1706]
(c) Microsoft Corporation. All rights reserved.
C:\Users\ELCOT>kubectl
kubectl controls the Kubernetes cluster manager.
Find more information at: https://kubernetes.io/docs/reference/kubectl/
Basic Commands (Beginner):
create Create a resource from a file or from stdin
expose Take a replication controller, service, deployment or pod and expose it as a new Kubernetes service
run Run a particular image on the cluster
set Set specific features on objects
Basic Commands (Intermediate):
explain Get documentation for a resource
get Display one or many resources
edit Edit a resource on the server
delete Delete resources by file names, stdin, resources and names, or by resources and label selector
Deploy Commands:
rollout Manage the rollout of a resource
scale Set a new size for a deployment, replica set, or replication controller
autoscale Auto-scale a deployment, replica set, stateful set, or replication controller
Cluster Management Commands:
certificate Modify certificate resources.
cluster-info Display cluster information
top Display resource (CPU/memory) usage
cordon Mark node as unschedulable
uncordon Mark node as schedulable
drain Drain node in preparation for maintenance
taint Update the taints on one or more nodes
Troubleshooting and Debugging Commands:
describe Show details of a specific resource or group of resources
logs Print the logs for a container in a pod
attach Attach to a running container
exec Execute a command in a container
port-forward Forward one or more local ports to a pod
proxy Run a proxy to the Kubernetes API server
cp Copy files and directories to and from containers
auth Inspect authorization
debug Create debugging sessions for troubleshooting workloads and nodes
Advanced Commands:



C:\WINDOWS\system32\cmd.exe - docker login
kubectl [flags] [options]
Use "kubectl <command> --help" for more information about a given command.
Use "kubectl options" for a list of global command-line options (applies to all commands).
C:\Users\ELCOT>cd C:\Program Files\job-portal-main\job-portal-main
C:\Program Files\job-portal-main\job-portal-main>kubectl create -f deployment.yaml
error: the path "deployment.yaml" does not exist
C:\Program Files\job-portal-main\job-portal-main>kubectl create -f deployment.yaml
error: the path "deployment.yaml" does not exist
C:\Program Files\job-portal-main\job-portal-main>docker login
Authenticating with existing credentials...
Login Succeeded



C:\WINDOWS\system32\CMD.exe
--template='':
Template string or path to template file to use when -o=go-template, -o=go-template-file. The template format
is golang templates [http://golang.org/pkg/text/template/#pkg-overview].
--validate='strict':
Must be one of: strict (or true), warn, ignore (or false). "true" or "strict" will use a schema to validate
the input and fail the request if invalid. It will perform server side validation if ServerSideFieldValidation
is enabled on the api-server, but will fall back to less reliable client-side validation if not. "warn" will
warn about unknown or duplicate fields without blocking the request if server-side field validation is enabled
on the API server, and behave as "ignore" otherwise. "false" or "ignore" will not perform any schema
validation, silently dropping any unknown or duplicate fields.
--windows-line-endings=true:
Only relevant if --edit=true. Defaults to the line ending native to your platform.
Usage:
kubectl create -f FILENAME [options]
Use "kubectl <command> --help" for more information about a given command.
Use "kubectl options" for a list of global command-line options (applies to all commands).
C:\Program Files\job-portal-main\job-portal-main>kubectl create -f service.yaml
error: the path "service.yaml" does not exist
C:\Program Files\job-portal-main\job-portal-main>kubectl create -f deployment.yaml
deployment.apps/flask-node-deployment created
C:\Program Files\job-portal-main\job-portal-main>



C:\WINDOWS\system32\CMD.exe
